USER MANUAL · ADMINISTRATION

Module Settings

The rules of CRM, Treasury and Factoring that an administrator can change without a new release. Every change takes effect only when a second user approves it.

Version 1.0 **Date** 7 November 2026 **Covers** CRM · Treasury · Factoring

0 Quick start

MAKER

Change a setting

1. Home → Administration → Module Setup
2. Open the module tab
3. **Change**, enter the new value and the reason
4. **Ask for approval**

CHECKER

Approve or reject

1. Open Module Settings: the tab shows how many changes wait
2. Read the orange box: old value → new value and the reason
3. **Approve**: the new value is in force at once
4. or **Reject** with the reason

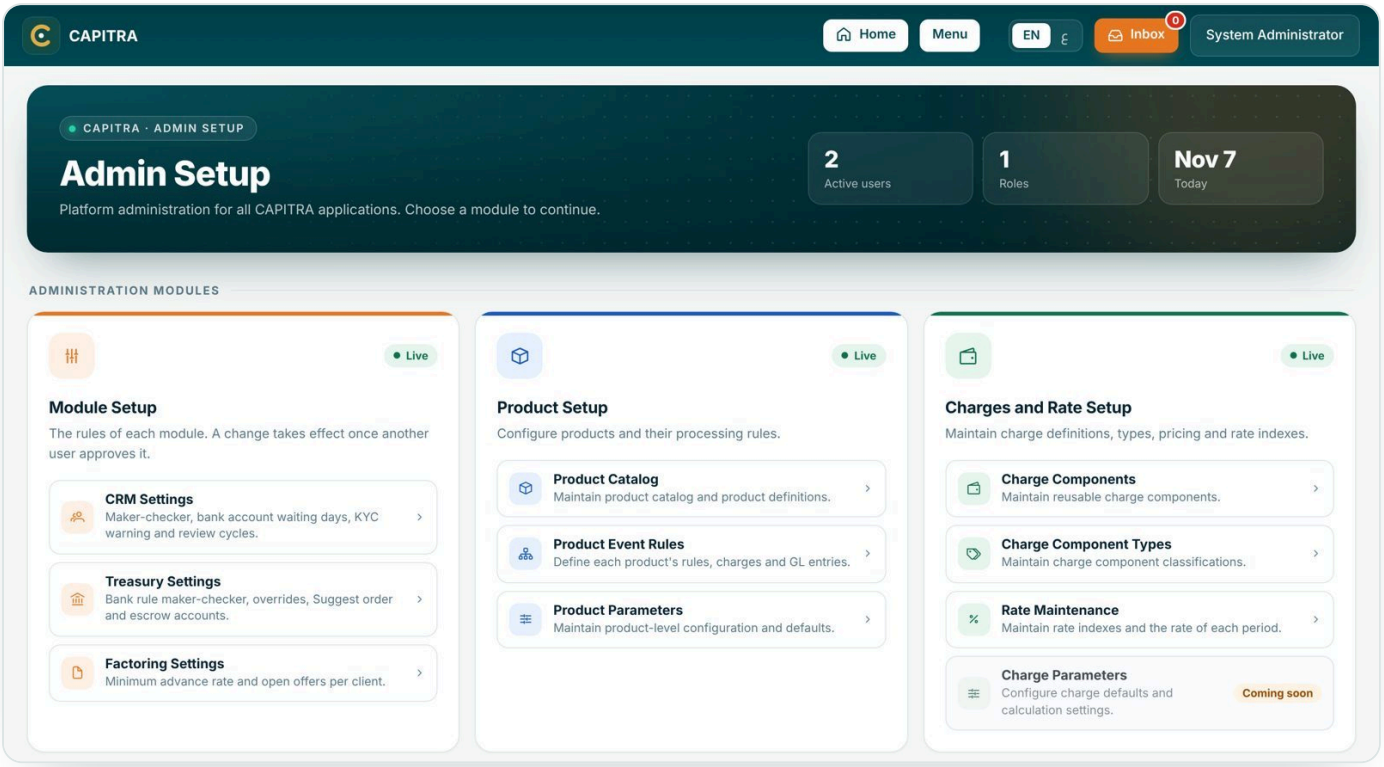

Figure 1. Administration: the Module Setup card opens each module's tab.

1 How a change works

1. A change is a **request**. Until it is approved the current value stays in force everywhere.
2. Another user approves it. The user who asked cannot approve their own change, whatever the module settings say.
3. The user who asked can **Withdraw** the request. A setting has one request at a time.
4. After approval each row shows who changed it and who approved it, with the date.
5. A setting never changed shows **Default value**: the rule as it was before the setting existed.

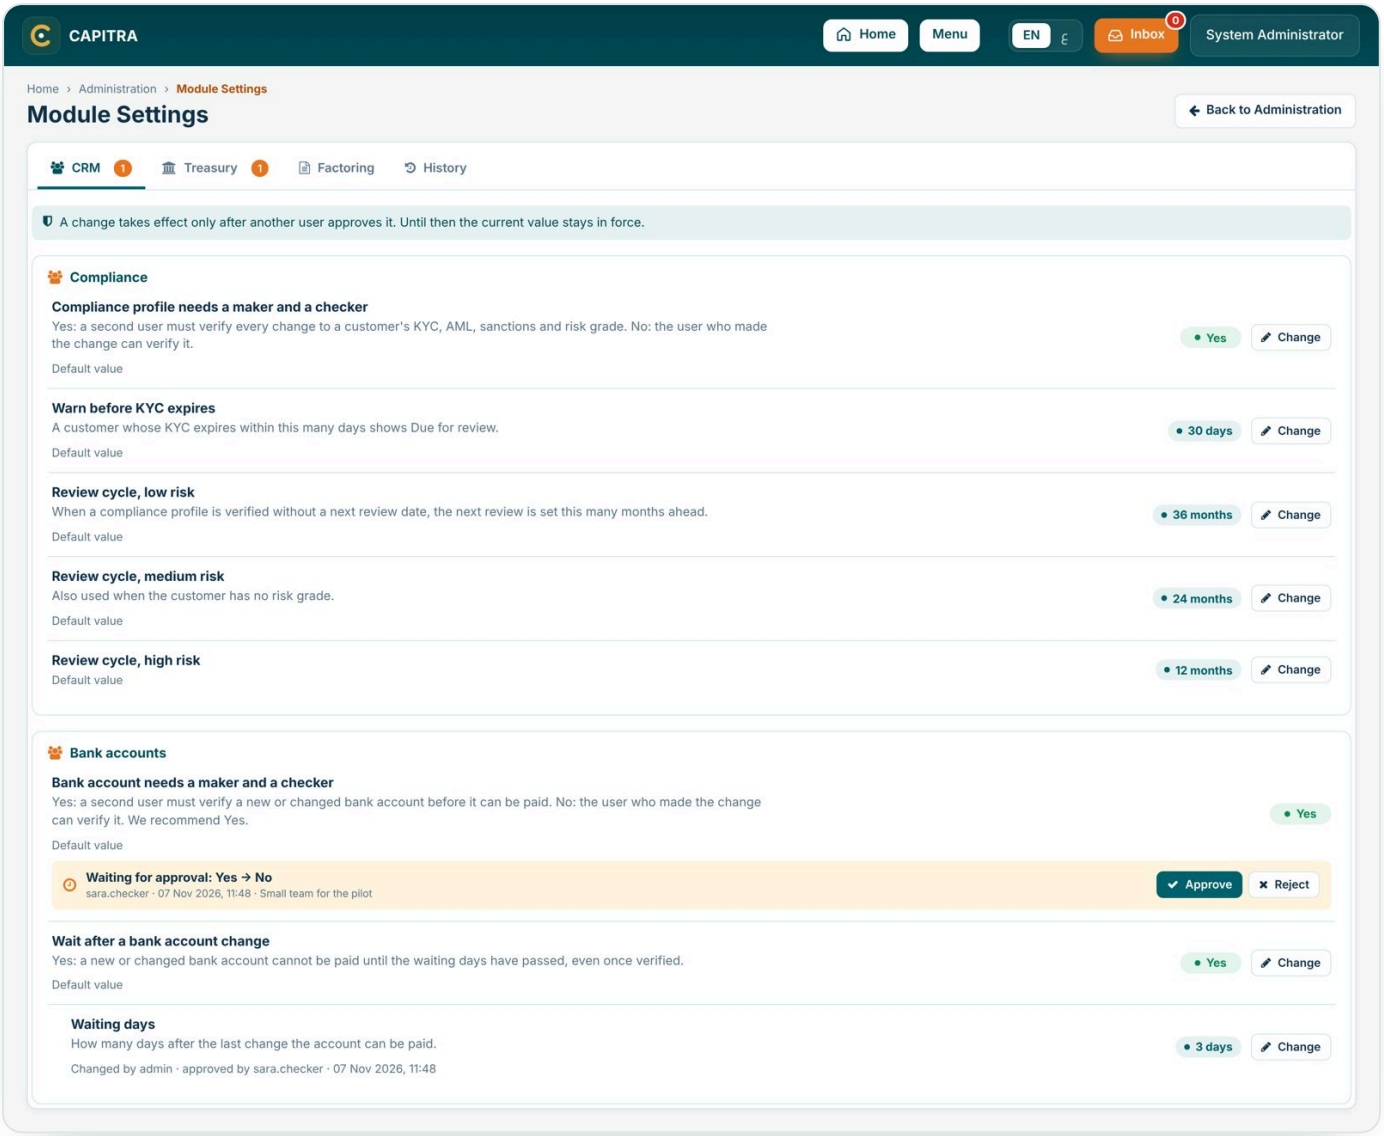

Figure 2. The CRM tab. Each setting shows its value; a request waiting for approval shows in orange.

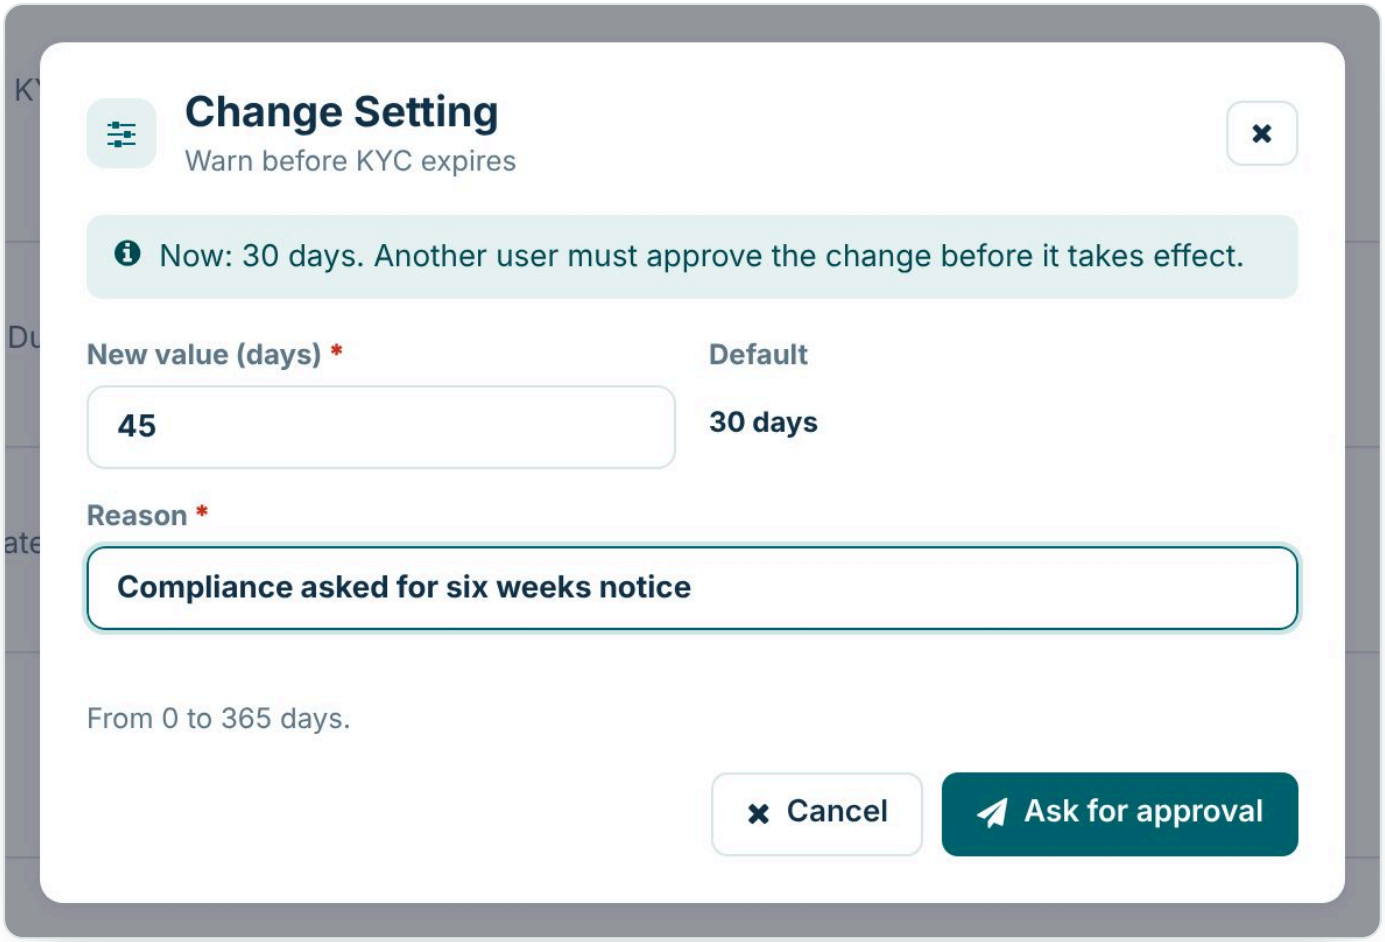

Figure 3. Change Setting: the new value, the default and the reason.

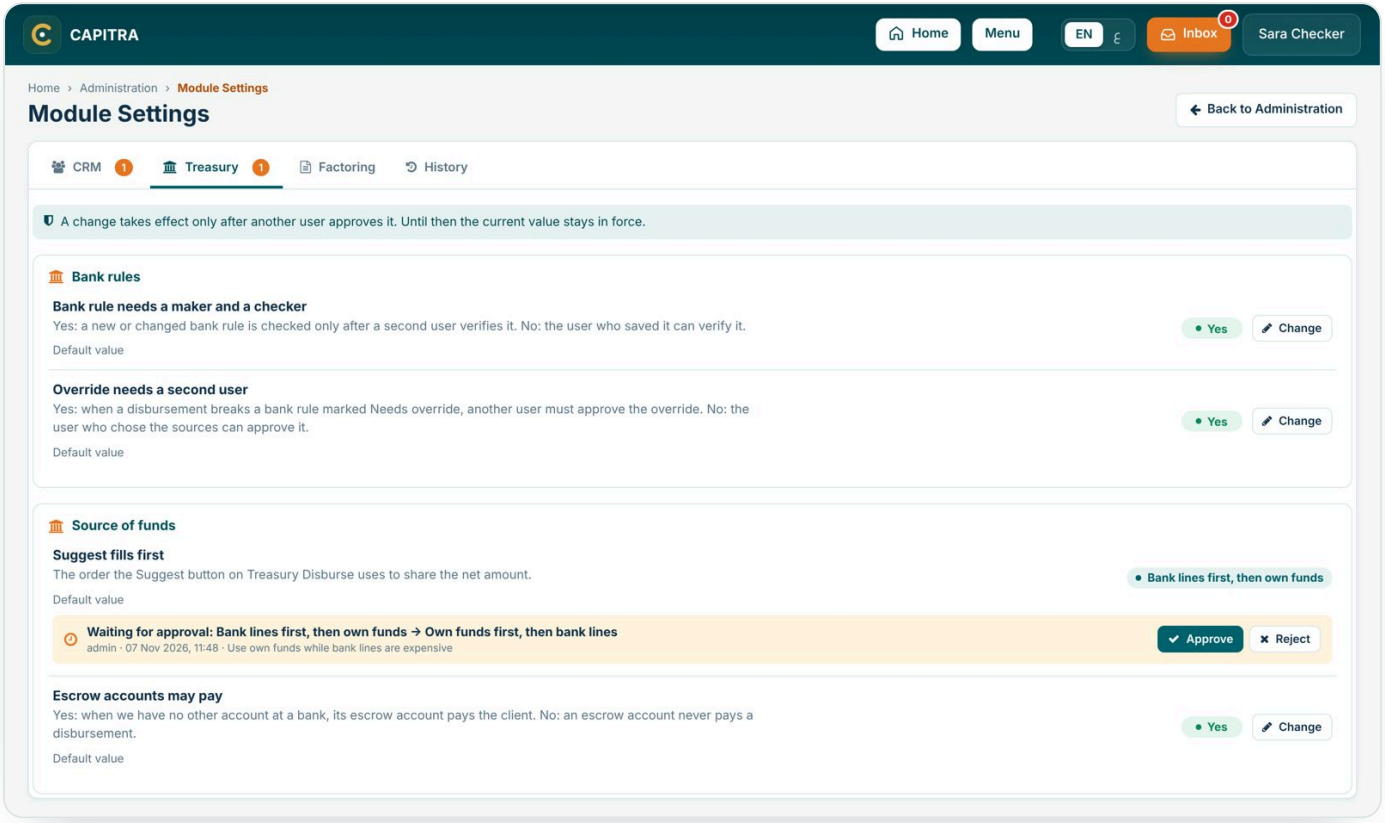

Figure 4. A second user sees Approve and Reject.

2 CRM settings

SETTING	DEFAULT	WHAT IT DOES
Compliance profile needs a maker and a checker	Yes	Yes: another user verifies every change to KYC, AML, sanctions and risk grade. No: the user who made the change may verify it.
Warn before KYC expires	30 days	A customer whose KYC expires within these days shows **Due for review** on Customer 360.
Review cycle: low / medium / high risk	36 / 24 / 12 months	When a compliance profile is verified without a next review date, the next review is set this many months ahead by the risk grade (medium when there is none).
Bank account needs a maker and a checker	Yes (recommended)	Yes: another user verifies a new or changed bank account. No: the user who made the change may verify it. The verification method is still recorded.
Wait after a bank account change	Yes	Yes: a verified account can be paid only after the waiting days. No: it can be paid once verified.
Waiting days	2 days	Shown only while the waiting period is Yes. From 1 to 90 days after the last change.

WHERE Customer 360 → Compliance and Bank Accounts. The note on the Bank Accounts tab says the rule in force, for example "needs another user's verification, then waits 3 day(s)".

3 Treasury settings

SETTING	DEFAULT	WHAT IT DOES
Bank rule needs a maker and a checker	Yes	Yes: a new or changed bank rule is checked only after another user verifies it. No: the user who saved it may verify it.
Override needs a second user	Yes	Yes: a disbursement that breaks a rule marked Needs override waits for another user to approve. No: the user who chose the sources may approve it. The reason is always required.
Suggest fills first	Bank lines first	Bank lines first: the bank lines with the most available, within every rule, then own funds with the rest. Own funds first: the whole amount on own funds.
Escrow accounts may pay	Yes	Yes: an escrow account pays only when we have no other account at that bank. No: an escrow account never pays a disbursement.

WHERE Treasury → Bank Limits (rules) and Treasury Disburse (Suggest, override, Payment panel). See the Treasury manual, sections 3 and 6.

4 Factoring settings

SETTING	DEFAULT	WHAT IT DOES
Minimum advance rate	50%	The pricing calculator never gives an advance rate below this, whatever the dilution and risk buffer.
A client can have several open offers	No	No: a client has one open offer at a time (draft, submitted or accepted). Use In Offer loads the open draft, and stops when an offer is already submitted or accepted. Yes: Use In Offer always creates a new offer.

WHERE Factoring → the pricing calculator and its Use In Offer button.

5 Permissions and history

PERMISSION	ALLOWS
`ADM.SETTINGS.VIEW`	Open Module Settings and read the values and history
`ADM.SETTINGS.EDIT`	Ask for a change, withdraw it, and approve or reject another user's change

The **History** tab lists every request, approval, rejection and withdrawal: when, who, the setting, the old and new value, and the reason.

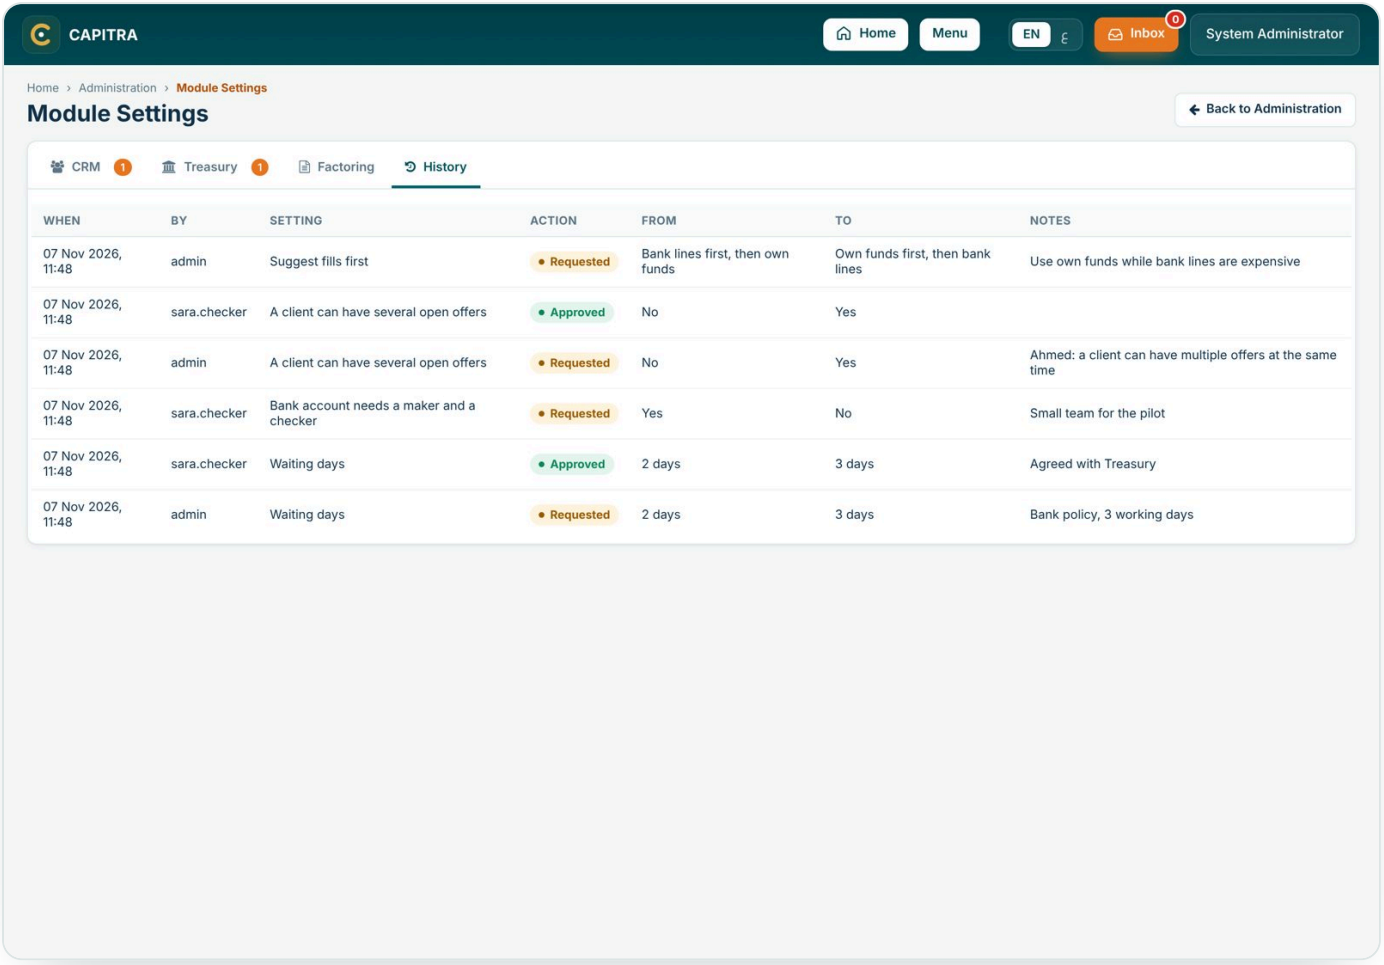

Figure 5. The History tab.
